Data Is Ugly

Google News has created a map for COVID 19 data showcasing how many cases per state there are to each other in the US. However this is a bit of a lackluster data visualization.

I have gone ahead and pulled public COVID19 data from multiple sources then plotted not only each state, but each county. My strategy was to showcase the depth of how drastic the counties are from each other. I was able to accomplish this by setting the number of cases to the elevation of the hexagons. This way you can see each county's impact.

I was also able to make a correlation between population of a county and covid cases and plot that to see if more people made a bigger difference or not.
